

ABSTRACT

A method of providing telecommunication services in a telecommunication system comprising a terminal, a serving network providing the terminal with services, and a bearer network in functional connection with the serving network. One or more databases comprising subscriber data are created in the telecommunication system, said subscriber database(s) being in functional connection with the bearer network. Data according to said subscriber database, such as a subscriber identifier, are transmitted to the serving network and/or the terminal. The terminal is provided with services in accordance with the transmitted subscriber data.
